Contents

(continued from page 4 of cover)

Binary collision theory for thermal and nonisothermal relaxation and reaction of polyatomic molecules
P. Talkner, E. Pollak and A.M. Berezhkovskii 131

On the role of the energy loss in turnover theories of activated rate processes
A.N. Drozdov and J.J. Brey 147

The Kramers problem in 2D-coupled periodic potentials
G. Caratti, R. Ferrando, R. Spadacini and G.E. Tommei 157

Curvilinear-path based theory of the energy transfer limited rate of a two-dimensional solute in a dissipative bath
S.K. Reese and S.C. Tucker 171

Saddle point avoidance due to inhomogeneous friction
G.J. Moro and F. Cardin 189

Reversible chemical reactions in slowly relaxing environments: Kramers' turnover of the rate constant
A.M. Berezhkovskii, V.Yu. Zitserman, D.-Y. Yang and S.H. Lin 201

Phase space distribution function approach to the Kramers problem. III. Anharmonic potentials
J. Morelli and D.J. Tannor 213

Where is the exit point?
Z. Schuss and A. Spivak 227

Nonadiabatic reactions in condensed phase in the absence of thermal equilibrium
I. Rips 243

Photochemical accumulation and recombination of ion pairs undergoing the singlet–triplet conversion
A.I. Burshtein and A.Yu. Sivachenko 257

Non-adiabatic effects in condensed phase activated rate processes in the near-adiabatic limit
A.I. Shushin and M. Tachiya 267

Non-equilibrium interlevel transitions in condensed phase far away from the avoided crossing region
M.V. Basilevsky, A.V. Soudackov and A.I. Voronin 281

Numerical simulations of solvation in simple polar fluids: dependence on the thermodynamic state below and above the critical point
P. Graf and A. Nitzan 297

A diffusive model for interpreting solvation dynamics in isotropic and ordered liquid phases
A. Polimeno, G. Saielli and P.L. Nordio 313
